Specification

On request, reducers can be manufactured in compliance with standards:

ATEX 94/9/CE

Categories: 2GD T=135 °C (T4)
3GD T=135 °C (T4)

Modularity

BA Aluminium alloy series

CBA Compact electric motor versions.

BA Fitted for motor coupling version (PAM).

IBA Input shaft versions.

B Grey cast iron series

CB Compact electric motor versions.

B Fitted for motor coupling version (PAM).

PB Fitted for motor mounting with flexible coupling.

IB Input shaft versions.

Design features

Motovario products are supplied with the following surface treatment features:

Die-cast aluminium alloy cases for gears

Die-cast materials undergo the following surface cleaning operations:

- De-burring by means of a mechanically operated shearing system
- Accurate shot-peening. - Painting
- Washing and passivation

Grey-coloured cast-iron cases for gears

- Die-cast materials are always painted

Painting specifications:

Orange-peel blue epoxy-polyester RAL 5010. Polyester resin based heat-hardening powders, altered with epoxy resins.

Mechanical properties

- Tests carried out onto degreased Unichim white latters (film thickness: 60 microns) comply with the following specifications: adherence (ISO2409), Erichsen drawing (ISO152), inverted shock (DIN53158), cone-shaped mandrel (DIN53151), hardness (ASTM D3363/74).

Heat resistance

- 24 HOURS AT 150°C.

Corrosion strength

- ASTM B 117/97 salt fog from 100 to 500 hours depending on the support's preliminary treatment.

Performance:

Loading capacity in accordance with DIN 3990, ISO 6336, AGMA 2101, ISO 10300, DIN 3991, ISO 281, DIN 743

Dynamic efficiency η_d :

The operating efficiency is the ratio between the output power P2 and the power absorbed by the gear reducer P1:

$$\eta_d = P2/P1$$

B/BA-range helical bevel gear reducers have an average value equal to:

- B..3 stages = 0,9
- BA..2 stages = 0,95
- BA..3 stages = 0,9

Product selection guide

For correctly selecting a gear reducer or geared motor, several essential pieces of data are required:

A - The rotational input speed to the gear reducer (**n1**) and the rotational output speed (**n2**).

Through these two values it is possible to calculate the reduction ratio (**i**) of the gear reducer using the following formula:

$$i = \frac{n1}{n2}$$

B - The torque required by the application (**Mr2**).

The geared motor or gear reducer can be selected once this data is known.

Geared motor selection

This guide indicates a brief sequence of steps for selecting a suitable product:

- 1 Determine the application's actual service factor (**s.f.**). This parameter depends on the type of load of the powered machine, the number of starts per hour and the hours of operation (refer to the "Service factor" paragraph on page 5)
- 2 Calculate the input power **Pr1** using the required torque value **Mr2**, the speed **n2** and dynamic efficiency value.

$$Pr1 = \frac{Mr2 \cdot n2}{9550 \cdot \eta d}$$

The dynamic efficiency value depends on the type of gear reducer and on the number of gear reduction stages. (To calculate the efficiency value see page 3).

- 3 Consult the geared motor performance tables and identify a normalised power value **Pn1** exceeding the required power **Pr1**, such that:

$$Pn1 \geq Pr1$$

- 4 Once the suitable normalised power has been identified, select the geared motor capable of generating the rotational speed closest to the desired **n2** value and with service factor **s.f.** greater or equal to that required by the application.

In the geared motor selection tables the combinations include 4-pole and 6-pole motors powered at 50Hz; for different drive speeds refer to the nominal data provided for the gear reducers.

Gear reducer selection

- 1 Determine the application's service factor (**s.f.**) (consult to the "Service factor" paragraph on page 5).
- 2 Calculate the reduction ratio **i** from the requested output speed **n2** and from the input speed **n1**.

$$i = \frac{n1}{n2}$$

- 3 Calculate the torque **Mc2** for selecting the gear reducer through the torque required by the application **Mr2** and the service factor **s.f.**:

$$Mc2 = Mr2 \cdot (f.s.)$$

- 4 Consult the gear reducer performance tables and identify the gear reducer that - with a reduction ratio closest to the calculated ratio - has a nominal torque **M2** such that

$$M2 \geq Mc2$$

If the selected gear reducer will be combined with an electric motor, verify the relevant applicability by consulting the configurations table (refer to the "Configurations" paragraph on page 20).

Checks

Once the gear reducer or geared motor has been selected, the following checks should be performed:

A - Thermal power

The gear reducer's thermal power must be equal to or greater than the installed mechanical power, or the power required by the application according to the indications contained in the section (refer to the "Thermal power" paragraph on page 7).

B - Maximum torque

Generally, the maximum torque (peak instantaneous load) that can be applied to the gear reducer must not exceed 200% of the nominal torque **M2**.

C - Radial loads

Verify that the radial loads acting on the input and/or output shafts are within with the values indicated in the catalogue. If they exceed these values, increase the size of the gear reducer or modify the external load capacity.

During the checking phase, it is important to remember that the values indicated in the catalogue refer to loads acting on the mid-point of the shaft protrusion, therefore, if the load is applied to a different position, appropriate formulas must be used to calculate the admissible load in the desired position (refer to the "Radial loads" paragraph on page 10).

Service factor

The service factor (f.s.) depends on the operating conditions the gear reducer is subjected to.

The parameters that need to be taken into consideration to select the most adequate service factor correctly comprise:

- type of load of the operated machine : A - B - C
- length of daily operating time: hours/day (Δ)
- start-up frequency: starts/hour (*)

LOAD: A - uniform $fa \leq 0.3$
 B - moderate shocks $fa \leq 3$
 C - heavy shocks $fa \leq 10$

$fa = Je/Jm$

- Je (kgm^2) moment of reduced external inertia at the drive-shaft
- Jm (kgm^2) moment of inertia of motor

If $fa > 10$ call our Technical Service.

A - Screw feeders for light materials, fans, assembly lines, conveyor belts for light materials, small mixers, lifts, cleaning machines, fillers, control machines.

B - Winding devices, woodworking machine feeders, goods lifts, balancers, threading machines, medium mixers, conveyor belts for heavy materials, winches, sliding doors, fertilizer scrapers, packing machines, concrete mixers, crane mechanisms, milling cutters, folding machines, gear pumps.

C - Mixers for heavy materials, shears, presses, centrifuges, rotating supports, winches and lifts for heavy materials, grinding lathes, stone mills, bucket elevators, drilling machines, hammer mills, cam presses, folding machines, turntables, tumbling barrels, vibrators, shredders.

Critical applications

B	A40	A50	A70
2000 < n1 < 3000	-	-	-
V6	B	B	B
n1 > 3000	B	B	B
...L: B6 - B7	B	B	B

B	060	080	100	125	140	150	160
2000 < n1 < 3000	-	-	-	B	B	B	B
V6	B	B	B	B	B	B	B
n1 > 3000	B	B	B	B	A	A	A
...L: B6 - B7	B	B	B	B	B	B	B

A - Application not recommended **B** - Check the application and/or call our technical service

The performance given in the catalogue correspond to mounting position B3 or similar, ie. when the first stage is not entirely immersed in oil. For other mounting positions and/or particular input speeds, refer to the tables that highlight different critical situations for each size of gear reducer.

It is also necessary to take due consideration of and carefully assess the following applications by calling our Technical Service:

- To avoid the use as multiplier.
- Use in services that could be hazardous for people if the gear reducer fails.
- Applications with especially high inertia.
- Use as a lifting winch.
- Applications with high dynamic strain on the case of the gear reducer.
- In places with T° under -5°C or over 40°C.
- Use in chemically aggressive environments.
- Use in a salty environment.
- Mounting positions not envisaged in the catalogue.
- Use in radioactive environments.
- Use in environments pressures other than atmospheric pressure.

Avoid applications where even partial immersion of the reducer is required.

The maximum torque (*) that the reducer can support must not exceed two times the nominal torque (f.s.=1) stated in the performance tables.

(*) intended for momentary overloads due to starting at full load, braking, shocks or other causes, particularly those that are dynamic.

Thermal power Pth [kW]

The table below lists the nominal thermal power values expressed in kW, in the following reference conditions:

- mounting position B3
- continuous operation at input speed $\leq 1,500$ rpm
- ambient temperature 25°C
- sea level altitude
- air speed near the gear reducer $\geq 1\text{m/s}$
- absence of external radial and/or axial loads

Thermal power values at 1,500 rpm	
Gear reducer	Pth [kW]
B063	10.5
B083	11.0
B103	12.5
B123	19.0
B143	22.5
B153	38.0
B163	55.0

Applying a power level not exceeding Pth

- at the above-mentioned reference conditions - guarantees the correct lubrication and efficient operation of the gear reducer.

NOTE: For the BA series it is not necessary to check the thermal power.

Application check

Except for continuous operating times below two (2) hours and successive pauses capable of bringing the gear reducer back to ambient temperature, for each application it is advisable to verify the gear reducer's thermal limit according to the following formula:

$$P_m < P_{th} * F_c * F_v * F_a,$$

where:

P_m = input power to the gear reducer at 1,400 rpm (4-pole motors)

P_{th} = thermal power at the reference conditions (see above table)

F_c = ambient and operating temperature correction factor

F_v = ventilation correction factor

F_a = altitude correction factor

The correction factors refer to different operating conditions compared to the reference conditions, and are provided by the following ISO14179 tables:

F _c		Duty per hour of operation %				
		100	80	70	40	20
Ambient temperature °C	10	1.15	1.21	1.32	1.55	2.07
	18	1.07	1.12	1.23	1.44	1.93
	25	1.00	1.05	1.15	1.35	1.80
	30	0.93	0.98	1.07	1.26	1.67
	40	0.83	0.87	0.95	1.12	1.49
	43	0.75	0.79	0.86	1.01	1.35
	50	0.67	0.70	0.77	0.90	1.21

Thermal power Pth [kW]

Ventilation correction factor	Fv
Stagnant air (<0,5 m/s)	0.75
Indoor installation with slight ventilation	1
Indoor installation with good ventilation (>1,4 m/s)	1.4
Outdoor installation (>3,7 m/s)	1.9

Altitude correction factor	Fa
0*	1
750	0,95
1500	0,90
2250	0,85
3000	0,81

* Sea level

- In case of operation at input speeds exceeding 2,000 rpm, or ambient temperatures greater than 40°C, it is advisable to contact our technical department.

Installation

To install the gear reducer it is necessary to note the following recommendations:

- Check the correct direction of rotation of the gear reducer output shaft before fitting the unit to the machine.
- In the case of particularly lengthy periods of storage (4/6 months), if the oil seal is not immersed in the lubricant inside the unit, it is recommended to change it since the rubber could stick to the shaft or may even have lost the elasticity it needs to function properly.
- Whenever possible, protect the gear reducer against solar radiation and bad weather.
- Ensure the motor cools correctly by ensuring good passage of air from the fan side.
- In the case of ambient temperatures $< -5^{\circ}\text{C}$ or $> +40^{\circ}\text{C}$ call the Technical Service.
- The various parts (pulleys, gear wheels, couplings, shafts, etc.) must be mounted on the solid or hollow shafts using special threaded holes or other systems that anyhow ensure correct operation without risking damage to the bearings or external parts of the units. Lubricate the surfaces in contact to avoid seizure or oxidation.

- Painting must definitely not go over rubber parts and the holes on the breather plugs, if any.
- For units equipped with oil plugs, replace the closed plug used for shipping with the special breather plug.
- Check the correct level of the lubricant through the indicator, if there is one.
- Starting must take place gradually, without immediately applying the maximum load.
- When there are parts, objects or materials under the motor drive that can be damaged by even limited spillage of oil, special protection should be fitted.

Motor mounting with PAM flange B5

When the unit is supplied without motor, it is necessary to follow these recommendation to ensure the correct assembly of the electric motor.

Check that the tolerances for the motor shaft and flange correspond to the "standard". Carefully clean the shaft, spigot and surfaces of the flange removing traces of paint and dirt, and confirm the key is fitted correctly.

Fit the half coupling/sleeve to the motor shaft (see picture) taking care to ensure the motor shaft and bearings are not damaged by avoiding excessive force and where necessary using assembly equipment.

Place the couplings elastic element onto the motor half coupling and position the motor up to the gear unit ensuring the coupling element is aligned with the driven half coupling. Complete the assembly using the fixing bolts. Key-ways with tightened tolerances.

Flexible joint

PAM Sleeve

Overhung load

The value of the admissible radial load (N) is given in the tables relating to the performance of the gear reducer at issue. It is related to the load applied on the centre line of the shaft and in the most unfavourable conditions of angle of application and direction of rotation.

The maximum admissible axial loads are 1/5 of the value of the given radial load when they are applied in combination with the radial load.

The tables relating to the output shafts give the maximum admissible value. This value must never be exceeded since it relates to the strength of the case.

Particular conditions of radial load higher than the limits of the catalogue may occur. In this case, call our Technical Service and provide details on the application: direction of the load, direction of rotation of the shaft, type of service.

In case of double extension shafts with radial load applied on both ends, the max. admissible radial loads must be defined according to the specific running conditions, in this case call our Technical Service.

The radial load on the shaft is calculated with the following formula:

$$F_{re} = \frac{2000 \cdot M \cdot f_z}{D} \leq F_{r1} \text{ o } F_{r2}$$

F_{re} (N) Resulting radial load

M (Nm) Torque on the shaft

D (mm) Diameter of the transmission member mounted on the shaft

F_r (N) Value of the maximum admitted radial load

F_{r1}-F_{r2} (see relative tables)

f_z = 1,1 gear pinion

1,4 chain wheel

1,7 v-pulley

2,5 flat pulley

When the resulting radial load is not applied on the centre line of the shaft, it is necessary to adjust the admissible radial load F_{r1-2} with the following formula:

$$F_{rx} = \frac{F_{r1-2} \cdot a}{(b + x)}$$

a, **b** = values given in the tables on page 13 - 14

x = distance from the point of application of the load to the shaft shoulder

Output radial loads

When the radial load is not on the centre line of the shaft, it is necessary to adjust the admissible radial load F_{r2} with the following formula:

$$F_{rx} = \frac{F_{r2} \cdot a}{(b + x)}$$

B	A42	A52 A53	A72 A73

083	8503
103	23866
123	35568
143	78517
153	118934
163	317590

Following values are indicative only and refer to gear reducers fitted with input PAM.
These values refer to maximum moment of inertia.

Lubrication

In cases of ambient temperatures not envisaged in the table, call our Technical Service.
In the case of temperatures under -30°C or over 60°C it is necessary to use oil seals with special properties.

For operating ranges with temperatures under 0°C it is necessary to consider the following:

- 1 The motors need to be suitable for operation at the envisaged ambient temperature.
- 2 The power of the electric motor needs to be adequate for exceeding the higher starting torques required.
- 3 In case of cast-iron gear reducers, pay attention to impact loads since cast iron may have problems of fragility at temperatures under -15°C.

- 4 During the early stages of service, problems of lubrication may arise due to the high level of viscosity taken on by the oil and so it is wise to have a few minutes of rotation under no load.

The oil needs to be changed after approximately 10,000 hours/2 years of operations.
This period depends on the type of service and the environment where the gear reducer works. For units supplied without oil plugs, lubrication is permanent and so they need no servicing.

If 'special' lubricant is required please contact for Technical Assistance

Lubrification

- For the reduction units B series it is always necessary to specify the mounting position.
 - The reduction units BA.. series with 2, 3 stages and B060, are supplied complete with lubricant, have no oil plugs and need no maintenance.
 - The gear reducer B series sizes 080, 100, 125, 140, 150, 160 are supplied complete with lubricant and are fitted with oil plugs to suit any mounting position included in the catalogue.
- It is recommended, after installation, to replace the closed plug used for transportation with the supplied breather plug.

- Quantity of oil in litres ~

Lubricant quantities are only indicative. For correct filling always refer to the sight glass or the dipstick, when this is supplied.

Any oil level differences can be caused by constructive tolerances but also on the mounting position or the assembly scheme of the customer. Therefore it is very important for the customer to check oil level and if necessary to add the necessary quantity.

Direction of rotation

CB - B - IB A42 - A52 - A72

CB - B - IB 063 ÷ 163

CB - B - IB A53 - A73

Helical bevel reduction units are supplied as "standard" with rotation as shown in the diagram. On request, the direction of rotation can be reversed; in this case, it is necessary to specify "opposite rotation to catalogue" when ordering. The "opposite rotation to catalogue" is not possible for sizes A42 - A52 - A53.

Mounting positions

B... - BA...

(C) - Blanking plug (S) - Breather plug (CL) - Blanking plug with dipstick (L) - Level plug (SR) - Breather plug with elbow

- For vertical positions, check with pages 6.
- Unless specified otherwise, the standard positions are B3/B5.
- For positions not envisaged, it is necessary to call our Technical Service.
- Symbols of plugs side by side refer to the presence of symmetrical plugs.

B/BA - Performances

0.16 HP

- Dimensions are in mm
- Clean and degrease the surfaces of the shaft to be fitted to. Comply with the indicated tightening torque of screws (MT)

Backstop device

The gear reducer can be supplied with backstop device on input shaft. Backstop device allows output shaft rotation in only one sense of direction; according to the size, it is available in the input flange or in the motor with the same dimensions. It is important to specify the required sense of direction on the order.

Reinforced oil seals

The reinforced seal can be done depending on the gearbox size by means of two oil seals or through the standard oil seal with VRM ring.

The difference of the two solutions is explained on the above drawings.

As an option, the gear reducer can be supplied with VITON seals.
